SHVETSKIY, et al., USSR Author's Certificate No 347909 kh 03 K 13/20, filed  
9 Aug 68, published 4 Sep 72.

The outputs of the discharge and transfer instruction shaper are connected respectively to the apparatus memory discharge bus and the apparatus transfer bus; the sign flipflop is connected to the output of the high-order position of the counter, and its output is connected to one of the inputs of the phase-sensitive detector and to the control input of the transfer apparatus.

To reduce conversion error, the discharge and transfer instruction shaper contains flipflops, an inverter, and coincidence circuit. One set of flipflop inputs is connected to the output of the frequency divider; the other flipflop inputs (except for the first) are connected to the output of the cyclic pulse generator.

The input of the first flipflop is connected to the output of the zero unit; the direct output of the second and the inverted output of the third flipflop are connected to one coincidence circuit, to which the direct output of the sign flipflop and the output of the cyclic pulse generator are also connected. The direct output of the third and the inverted output of the fourth flipflops are connected to the other coincidence circuit, to which the inverted output of the sign flipflop and the output of the cyclic pulse generator are also connected; the outputs of the coincidence circuits are connected through an inverter to the transfer bus. Three illustrations.

"A Method of Synthesizing Ethyl Ether of  $\beta$ -Aminoethylphosphoric Acid"

Moscow, Otkrytiya, Izobreteniya, Promyshlennyye Obraztsy, Tovarnyye Znaki, No 14, 1970, Author's Certificate No 268422, filed 22 Jul 68, p 24

Abstract: This Author's Certificate introduces: 1. A method of synthesizing ethyl ether of  $\beta$ -aminoethylphosphoric acid. As a distinguishing feature of the method, the process is simplified by interacting 0,0-diethyl- $\alpha$ ,  $\beta$ -chloroethyl phosphate with ammonia in an autoclave with the application of heat. 2. The method described in (1) is distinguished by the fact that the temperature reaches 65-70°C.

"Effect of Crystallographic Orientation of the Surface of Single Crystals of Silicon Dioxide and Magnesium Oxide on the Recombination Rate of Hydrogen Atoms"

Moscow, Zhurnal Fizicheskoy Khimii, Vol XLV, No 5, 1971, pp 1124-1127

**Abstract:** An experimental study was made of the recombination rate coefficients of hydrogen atoms on the [100], [111], and [110] faces of single crystals of MgO and [0001], 1120, and [1010] faces of single crystals of SiO<sub>2</sub>. The experimental procedure is described, and the data for the probability of recombination of hydrogen atoms on the given surfaces are tabulated. The surface activity depends on the crystallographic orientation and is determined by the crystal chemical characteristics of the surfaces. Admixtures contained in a single crystal of MgO can have no significant effect on the recombination reaction rate.

Good agreement between the data presented here and those obtained by other authors is noted and the results are generalized as proof that not only in 1/2 .

"Experimental Research in the Enthalpy of  $\text{Al}_2\text{O}_3$  in the 1,400-2,313 K Range"

Khar'kov, Ukr. resp. nauch.-tekhn. konf., posvyashch. 50-letiyu metrol. sluzhby USSR, 1972, -- sb. (Ukrainian Republic Scientific and Technological Conference Honoring the 50th Anniversary of the Ukrainian SSR's Metrological Service, 1972 -- Collection of Works), 1972, pp 68-69 (from Referativnyy Zhurnal -- Metrologiya i Izmeritel'naya Tekhnika, No 2, 1973, Abstract No 2.32.972 by V.S.K.)

Translation: The authors present the results of an experimental determination of the enthalpy of aluminum oxide at high temperatures (on the order of 1,400-2,313 K) right up to its melting point. The measurements were made by the mixing method, using large calorimeters with a copper block and an isothermal casing. Sapphire (with an  $\alpha$ - $\text{Al}_2\text{O}_3$  content of 99.9 percent) and corundum (with an  $\alpha$ - $\text{Al}_2\text{O}_3$  content of 99.99 percent) were used in the investigation. Fourteen enthalpy values were obtained in the 1,400-2,313 K range, and the experimental data were compared with the results of research described in the literature.

"Heat-Physical Properties of Rhenium at High Temperatures"

Moscow, Teplofizika Vysokikh Temperatur, Vol 11, No 1, Jan-Feb 73, pp 84-87.

**Abstract:** The electrical resistivity, heat conductivity and integral hemispherical degree of blackness of polycrystalline rhenium are measured in the 1200-3000° K temperature interval. Purity of the specimens used was 99.98%. They were produced by methods of powder metallurgy in the form of wires 0.3 mm in diameter. The differences between the data produced in this work and the data of other authors is discussed. Causes for variations in data include faulty techniques used in some earlier works, differences in densities of materials tested, and anisotropy of the properties of rhenium single crystals, in combination with preferential orientation of crystals in polycrystalline specimens.

"Some Physical Properties of a New Alloy in the Nickel-Rhenium-Molybdenum  
System"

Moscow, Teplofizika Vysokikh Temperatur, Vol 11, No 2, Mar/Apr 73, pp  
435-436

**Abstract:** The authors study the heat conduction, coefficient of thermal expansion and resistivity of an alloy in the nickel-rhenium-molybdenum system containing 10 wt.% Re and 15 wt.% Mo. Curves are given showing the temperature dependence of the measured parameters between 100 and 1000°C. The results indicate structural transformation of the alloy in the solid state. Analysis points to the possibility of formation of the so-called K-state observed in the region of solid solutions of the nickel-chromium system with more than 16% chromium. However, a final explanation of the observed anomalies will require further research.

"Electrical Resistance of Powder Metal Tungsten-Rhenium Alloys"

Kiev, Poroshkovaya Metallurgiya, No 10, Oct 72, pp 68-70

**Abstract:** The concentration and temperature relationships of electrical resistance were investigated for W-Re alloys within the limits of the tungsten solid solution. Powder metal alloys containing 5, 10, 19, 20, 21, and 27% Re were used in the 1200-3000°C temperature interval. Analysis of measurement data shows that the relationship of electrical resistance for W-Re alloys in the investigated range of compositions basically conforms to the Nordheim law, i.e., electrical resistance has a linear function to the product of atomic concentrations. Alloys with 20 and 21% Re deviate from the general principle, starting at approximately 1700°C. The formation of intermediate phases is assumed to be the cause of this anomaly.

The authors thank V. M. AMOSOV and Ye. I. PAVLOVA for useful observations during the discussion of the results obtained. 3 figures, 12 bibliographic references.

"On a Methodical Characteristic in the Investigation of the  
Spectral Emissivity of Metal by High Temperatures"

Moscow, Teplofizika Vysokikh Temperatur, Vol 10, No 2,  
Mar-Apr 72, pp 423—425

**Abstract:** By measurements of the spectral emissivity of metals  $\varepsilon(\lambda, T)$ , an additional reflected emission flux ( $a$ ), resulting from repeated reflections in the system specimen-sight glass, is considered, applicably to the most prevailing tube method. From formulas of the incident and reflected fluxes, a function for  $a$  is derived, showing that it increases with decreasing spatial angle  $\Omega$ , increasing reflectiveness of the specimen, and approaching of the sight glass. As a limiting value,  $a$  can be equal to the reflection coefficient of the sight glass, which is 8—12 %. Strictly speaking, the derived expression for  $a$  holds true only for flat specimens, but it is also satisfied with practically sufficient exactness for cylindrical specimens. Two illistr., twelve formulas, five bibliog. refs.

"Heat Conductivity of Pyrographite at High Temperatures"

Moscow, Teplofizika Vysokih Temperatur, Akademiya Nauk SSSR, Vol 9, No 1, Jan-Feb 1971, pp 80-81

**Abstract:** The specimens of pyrographite used to determine its heat conductivity were of tubular form, they were obtained by precipitation from methane at 2100°C temperature. The outside diameter of the tubes was 12 millimeter, wall thickness 1 and 2 millimeter. The specimen was heated by electric current passing through it, the heat generated was determined by measuring the current and the voltage drop.

The coefficient of heat conductivity in the radial direction was determined in the range of 1200 to 2500°K.

The results are compared with those obtained by other authors. The discrepancies are quite high. This is apparently due to differences in micro- and macro structure of pyrographite, which depends on precipitation temperature, heat treatment, specimen geometry and other factors. The discrepancies  
1/2

USSR

CHEKHOVSKOY, V. Ya., et al., Teplofizika Vysokih Temperatur, Akademiya Nauk SSSR, Vol 9, No 1, Jan-Feb 1971, pp 80-81

are also caused by systematic errors connected with different experimental methods.

The error analysis of the obtained results shows that the maximum relative systematic error in determining the coefficient of heat conductivity is 15 to 16%.

"Bis-hypophosphites (Tetraalkoxydiphosphines)"

Leningrad, Zhurnal Obshchey Khimii, Vol XLIII (CV), No 1, 1973, pp 66-69

**Abstract:** A report was made recently on the synthesis of tetraalkoxy diphosphines [A. L. Chekhun, et al., ZhOKh, No 40, 2516, 1970]. More detailed data are now presented on the methods of synthesizing this class of compounds and some of their properties. Two methods of synthesizing the tetraalkoxy diphosphines based on dialkoxyphosphines. The first method involves the interaction of dialkoxy phosphines with dialkylchloro phosphites:

This method does not permit tetraalkoxy diphosphines with the lowest radicals to be obtained. Thus, the reaction of dialkylchloro phosphites with tin hydrides in the presence of an organic base is proposed.:

"Spectral Properties of Phenylethynylphosphines and Phosphine Oxides"

Leningrad, Zhurnal Obshchey Khimii, Vol 42 (104), No 5, May 72, pp 995-999

**Abstract:** The authors' study revealed that phosphorus blocks the conjugated  $\pi$  systems of phenylethynyl groups in tertiary phenyl(phenylethynyl)phosphines and phosphine oxides. The spectral indications of conjugation in the oxide of p-dimethylaminophenyl-bis(phenylethynyl)phosphine are, probably, a result of the interaction of the  $\pi^*$  orbitals of the triple bond and the p-dimethylaminophenyl through the d orbitals of phosphorus. The article contains two illustrations of ultraviolet spectra and two tables. One table gives the physical properties of phosphorus-containing derivatives of phenylacetylene, and the other describes the dependence of the properties of the main band of dimethylanilines  $p-Xc_6H_4N(CH_3)_2$  on the nature of the substituent X.

"Determination of Fluid Pressure in a Rectangular Mold in the Presence of Crossed Electric and Magnetic Fields"

Tr. Donetsk. NII chern. metallurgii (Works of the Donetsk Scientific Research Institute of Ferrous Metallurgy), 1970, No 20 (4), pp 131-136 (from RZh-Mekhanika, No 7, Jul 71, Abstract No 7B10)

Translation: The authors consider distribution of electric current and Lorenz force in a rectangular parallelepiped all of whose walls are non-conductive with the exception of two identical electrodes of rectangular shape located opposite each other on parallel vertical walls. Constant current density is preassigned on the electrodes. An external magnetic field (the induced field is disregarded) which is uniform is horizontally directed across the main current. The solution is presented in the form of infinite series. Assuming that the parallelepiped contains a quiescent heavy fluid, and disregarding the horizontal component of the Lorenz force, the authors calculate the pressure in the fluid. A comparison with an experiment shows satisfactory accuracy of the calculation. S. A. Regirer.

ABSTRACT/EXTRACT--(U) GP-0- ABSTRACT. THE MOSSBAUER PROBABILITY AND THE ISOMERIC SHIFT ASSOCIATED WITH PRIME119 SN IMPURITY NUCLEI IN THE ALPHA PHASES OF THE AG-CO AND AG-ZN SYSTEMS WERE STUDIED. IN CONTRAST TO EXISTING VIEWS, THERE WAS NO MARKED CORRELATION BETWEEN THE ISOMERIC SHIFT AND THE M. PROBABILITY IN ALLOYS OF DIFFERENT COMPOSITIONS. THIS LACK OF AGREEMENT IS TENTATIVELY EXPLAINED BY MEANS OF A MODEL ACCORDING TO WHICH THE PROBABILITY IS DETERMINED BY THE VALENCE ELECTRONS OF THE IMPURITY ATOMS WHILE THE ISOMERIC SHIFT IS INSENSITIVE TO THE CONDUCTION BAND CHARACTERISTICS. A POSSIBLE APPLICATION OF THESE EFFECTS TO THE STUDY OF INTERNAL OXIDATION IN ALLOYS IS CONSIDERED.

"Waveguide Directional Couplers With Strong Coupling at the Wide Wall"

Tr. Kuybyshev. aviats. in-t (Works of the Kuybyshev Aviation Institute),  
1970, vyp. 44, pp 65-68 (from RZh-Radiotekhnika, No 6, Jun 71, Abstract  
No 6B168)

Translation: Various versions of couplers with coupling at the wide wall are considered. Cross-coupling attenuation is analyzed as a function of displacement of the coupling aperture relative to the wide wall and the dimensions of the aperture. It is noted that computational results agree satisfactorily with experimental data. Three illustrations, bibliography of four titles. N. S.

## BRIEF COMMUNICATIONS

SOVJETRS 54396  
03 NOV 71

## COORDINATION STRUCTURE OF HUMAN VOLUNTARY MOVEMENTS ACCOMPANYING STIMULATION

## OF THE HORIZONTAL SEMICIRCULAR CANALS BY ANGULAR ACCELERATIONS

(Article by I. F. Chekirda,<sup>*(Space physiology)*</sup> and F. A. Solodovnitski Moscow, Kosmicheskaya Biologiya i Meditsina, No. 5, Vol. 5, No. 4, pp. 83-86, 1971, submitted for publication 27 May 1970)

As is well known, the activity of a flier and cosmonaut transpires with exposure of the body, especially the vestibular analyzer, to different accelerations. Accordingly, the individual peculiarities determining the nature of vestibulomotor reflexes, and thus performance as a whole, assume great importance.

The literature contains a rather broad array of materials on the state of the visual and motor analyzers during motion sickness and adequate stimulation of the vestibular apparatus (Ye. N. Belontsovskiy, S. A. Il'ina; O. A. Chernikova; D. I. Aronov; A. S. Butyrev; I. Z. Perminov; L. S. Garshyan, A. A. Gambaryan; V. N. Barnaul'skiy; V. G. Gurfinkel, et al.; I. Ya. Malinovskaya, Yu. S. Yusevich, and others), particular attention was devoted to study of the final result of the performed movements, their duration, and the external picture of performed actions.

This paper gives the results of application of the photoelectrographometric method for studying the coordination structure of voluntary movements of the human arm accompanying stimulation of the vestibular apparatus.

The experiments were made on 10 males and females in the age group 25-38 years (nine of them with good vestibular tolerance and one with satisfactory vestibular tolerance). The subjects were exposed to a negative angular acceleration when the electrically rotated seat was stopped (S. S. Markaryan, et al.) in the plane of the horizontal semicircular canals (forward inclination of the head by 30°). The following motor skills were performed during the nystagmic reaction: slow flexure and slow extension at the elbow joint for one second with closed and open eyes with the mission of hitting a target (a contrasting circle 8 mm in diameter) on the elbow-test of the seat. Movements with identical performance of the final result of the action, hitting the target, were analyzed.

FLIGHT

FLIGHT

COORDINATION STRUCTURE OF WALKING OF SOYUZ-9 CREW MEMBERS BEFORE AND AFTER

Article by I. F. Chashikulina, R. B. Boroditshevskiy, A. V. Vozmishchenko and L. A.

Kolosov, Kosmonauticheskaya Biologiya i Mekhanika, Vol. 5, No. 6, 1971,

submitted for publication 18 November 1970, pp. 48-52/

**Abstract:** The cyclogrammetric method was used in studying the structure of walking of Soyuz-9 crew members after recovery. It is shown that the long-duration flight induced rearrangements in the walking structure which involved changes in the intensity and time of controlling impulses sent to the periphery, increases in the number of movement corrections, and other kinematic and dynamic peculiarities. During early readaptation one can discriminate two stages: a stage of a "stamping" gait, in which the changes are seen visually, and a stage of an "impact" gait in which the foot evidently impacts the support normally but the cyclogrammetric analysis reveals abnormalities in motor skills.

Some Soviet and American cosmonauts have exhibited an unstable gait during the first hours after landing, but no special study of gait peculiarities has been made. However, this is of both theoretical and practical importance because on the basis of the laws of structuring of gait and other locomotions during the readaptation period one can introduce corrections into the formulation of a rational regime for the motor activity of cosmonauts.

The biomechanics of gait in the cosmonauts A. Nikolayev and V. Sast'yanov was investigated early after landing (up to 5 days). The first period after landing, characterized by distinct changes in gait, lasted about 2 days. Gait was accompanied by clearly expressed autonomic reactions (facial reddening, pulse quickening). During walking the cosmonauts spread their legs far apart, the torso was shifted in the direction of the supporting leg, and they deviated from a straight trajectory. They frequently

"Determination of the Time of Infection With Brucellosis"

Moscow, Veterinariya, No 11, 1971, pp 52-53

Abstract: The blood sera of heifers and sheep vaccinated, experimentally infected and naturally infected with brucellosis were investigated to determine the time of infection by finding antibodies with different physical and chemical properties. Macroglobulin-type antibodies with a 19S sedimentation coefficient disintegrate under the influence of reducing agents into 7S subunits with a loss of specific activity. Investigation of blood serum of vaccinated heifers revealed that predominantly 19S macroglobulin antibodies are synthesized first, then destroyed from the effect of heat and 2-mercaptoethanol. During this 2- to 3-week period, the highest RA and Coomb's test titers were registered in intact samples. Subsequently, as the level of macroglobulin antibodies decreased, the titers of the thermostable 7S antibodies increased. One month after vaccination and infection, the ratio of 19S and 7S antibodies was approximately equal. A higher level of 7S antibodies was registered in 2.5 months. Five months later only macroglobulin antibodies in lower titers

1:25-1:60 were found. The 7S antibodies in lower titers were revealed for 13 months, the level of 19S antibodies being somewhat higher during that entire period. The higher level of 19S antibody content indicates recent infection (1-3 weeks), while finding 7S antibodies reveals an older infection (1-5 months). The low 19S and 7S antibody titers point to a much earlier infection process (6-16 months or more).

"Using Sheet Mills for Rolling Metal Powders"

Kiev, Poroshkovaya metallurgiya, No 2, Feb 72, pp 91-93

**Abstract:** The objective of this study was the potential use of conventional roll mills for high-speed rolling of metal powders. The experiment involved a 330 mill with a roll diameter of 394 mm and PZh-1M grade of metal powder with a bulk weight of 2.32 and shake-down weight of 2.80 g/cm<sup>3</sup>. The mill was equipped with a force-feed mechanism. The measurements included: a) the stresses at the contact surface of the metal powder with the roll; b) rolling torque; c) rpm of both the work rolls and the worm roll. The diagram of the force feed mechanism is shown. The study indicates that conventional roll mills are well suited for rolling metal powder into sheets and tape at roll speeds of 2 m/sec and higher on condition that the roll mills are equipped with force feed systems. "Pressure Working of Metals"

Obrabotka Metallov Davleniyem [English Version Above], Moscow, Metallurgiya Press, 1970, 350 pages.

Translation of Annotation: This collection presents the results of studies of processes of working of metals by pressure performed by the workers of the Dnepropetrovsk Metallurgical Institute in cooperation with the engineering and technical workers of various metallurgical plants.

The articles analyze theoretical and experimental problems of the dynamics and kinematics of section, sheet and tube rolling and data from combined studies of continuous mills. Materials are presented from a study of the process of periodic rolling.

Based on the results of the studies, conclusions and recommendations are given for improvement of the technology of plastic working of steel and the operation of rolling mill equipment.

The materials of the collection can be used by engineering and technical workers at metallurgical plants, planning-design organizations, and scientific research institutes for the solution of problems involved in the improvement of technologies and equipment, and also to increase the productivity of rolling

P 2, COLS 2-4

ABSTRACT-- THE ARTICLE IS A BRIEF BIOGRAPHICAL PROFILE OF ZOT IL'ICH NEKRASOV, DIRECTOR OF THE DNEPROPETROVSK INSTITUTE OF FERROUS METALLURGY /APPOINTED IN 1952/, LAUREATE OF THE LENIN AND STATE PRIZES, HERO OF THE SOVIET UNION AND MEMBER OF THE UKRAINIAN ACADEMY OF SCIENCES. HE WAS ELECTED CORRESPONDING MEMBER OF THE UKRAINIAN ACADEMY OF SCIENCES IN 1951. IT WAS ON HIS SUGGESTION THAT THE INSTITUTE OF FERROUS METALLURGY WAS RELOCATED FROM KIYEV TO DNEPROPETROVSK WHERE ITS STAFF GREW TO 1,200 PEOPLE. IN ADDITION TO BEING DIRECTOR OF THE INSTITUTE, NEKRASOV HEADS THE DEPARTMENT OF IRON METALLURGY. A. P. CHEKMAROV, K. F. STARODUBOV, V. D. CHEKHRANOV, I. G. UZLOV, A. V. PRAZDNIKOV, AND YU. N. TARAN ARE MENTIONED AS HIS COLLEAGUES.

"The Influence of Rarefaction Upon the Structure of a Free Jet of Nitrogen"

Moscow, Zhurnal Priklandoy Mekhaniki i Tekhnicheskoy Fiziki, No 1, 1971, pp 136-141

**Abstract:** The influence of rarefaction upon the structure of a free nitrogen jet is studied systematically on the basis of measurement of the density distribution. A quantitative and qualitative link is discovered between the intensity of the Mach disk in a jet of rarefied gas with density and incalculability. For the construction of a complete qualitative model of the initial sector of the jet behind a sonic nozzle at low density, it is necessary to investigate the conditions of transition from the described viscous flow to such a flow at which the change of density at the shock wave will be subject to the Hugoniot adiabat. 8 figures, 1 table, 4 bibliographic entries.

"A Device for Determining the Region of Operability of a Digital Computer  
With Respect to Supply Voltages"

USSR Author's Certificate No 291206, filed 7 Aug 68, published 29 Mar '71,  
(from RZh-Avtomatika, Tekhnicheskaya i Vychislitel'naya Tekhnika, No 10, Oct  
71, Abstract No 108146 P)

Translation: There is a well-known device which determines the region of operability of a digital computer with respect to supply voltages. This device contains a control unit, voltage commutation module, an element for controlling the sign of the independent voltage increment, and a device for visual display. However, such devices are incapable of monitoring the changes in digital computer elements which occur as a result of various ambient factors while the computer is in operation. To speed up determination of the limits of the region of operability and improve the reliability of measurements, the signal input of the device for controlling the sign of the independent voltage increment is fed from the output of the relay which Arthur's Certificate is connected to the control unit. The control module, while the control unit, input from the 1/2

MOV, A. I. et al., Soviet Patent No 291206

Output of the sign controller are connected to the control unit, the auxiliary output of the control unit being connected to the device for visual display, which is connected in turn to the voltage commutation module. This enables observation of the change in the region of operability of the digital computer with respect to supply voltages during operation, as well as evaluation of various computer characteristics (e.g., the availability factor, operability margin with respect to drift of element parameters, operating stability with respect to variations of the power supply and the ambient medium).

FIRST RESULTS OF OPERATION OF PREPARATORY DEPARTMENTS AT MEDICAL INSTITUTES  
OF THE RUSSIAN FEDERATION

Article by Ivanov, V. S.  
Stishovskiy, A.  
Zadravokhramov, R.  
Russian, No 10, 1971, submitted 20 May 1971, pp 41-43

As mentioned in the Decree of the Central Committee of the CPSU and of the Council of Ministers "On the Organization of preparatory departments at higher educational establishments" (August 1969), "among VUZ students are still too few blue collar and collective farm employed young people." For this reason, problems pertaining to involvement of the best prepared young men and women in medical school studies from industry and rural areas have been repeatedly discussed at special meetings of VUZ vice-chancellors as well as secretaries of enrollment commissions. As a result of the work done by enrollment commissions, medical institutions have obtained a considerable increase in representation of rural youth in the student body (Table 1). This was aided, in many respects, by the instructions of the USSR Ministry of Higher and Secondary Specialized Education, which allowed medical schools to some extent to accept individuals who are permanent residents of rural areas and whose grades at the entrance examination were 1 or 2 points lower than required for competitive enrollment into first-year classes.

However, even with 35-40 percent enrollment of rural residents in the first year classes, only a negligible number are referable to blue collar and farm workers, i.e., to individuals directly engaged in industry or agricultural work. As demonstrated by analysis of the social composition of students at the medical and pharmaceutical institutes of the RSFSR Ministry of Health from 1964 through 1970, there was no increase in number of workers or their children enrolled in all years and it constituted 30.7 percent of the total student body in 1970, while the number of farmers or their children dropped to 7.4 percent in 1970 (Table 2).

One could hardly consider this situation to be satisfactory, since the total composition of students enrolled in medical institutes does not even approximately correspond to the structure of our society, the vast majority of which consists of blue collar or farm workers. Furthermore, in number of cases, such a social structure of the student body in the medical schools of

FAMILIAL SCLEROMA ACCORDING TO MATERIALS  
OF TRANSCARPATHIAN REGION

A. M. Chekotilo, A. V. Smerenskaya

The authors present the results of a complex examination of 71 members of 26 families in which scleroma patients were revealed. Fifteen persons proved to be suffering from atrophic-infiltrative and scar changes of the mucous membranes of the upper respiratory tracts. In 7 of the patients scleroma diagnosis was confirmed bacteriologically or serologically. Reactions of complement fixation and of indirect hemagglutination were used for the purpose of serological examination. The results of these two reactions coincided; the advantage of the latter method for examination of the foci was demonstrated.

The necessity of complex clinico-epidemiological examination of the population in the districts with recorded scleroma cases for detection in the foci of patients with unestablished diagnosis was demonstrated.

Austenitno-boridnye stali i splavy dlya svarkikh konstruktsiv (Austenitic Boride Steels and Alloys for Welded Structural Elements), Kiev, Naukova Dumka Press, 1970, 147 pp, ill., 1 r. 8 k. (from RZh-Metallurgiya, No 4, Apr 71, Abstract 41604K)

Translation: Data are presented on alloying austenitic steels and alloys based on Fe-Cr-Ni, Fe-Cr-Mn, and Cr-Ni with boron. The effect of boron on the structure and properties of the indicated materials is investigated. The effect of boron on weldability, inclination toward local rupture, stress corrosion cracking, high temperature strength, and resistance to scaling of steel and alloys was studied. The structure and properties of new types of austenitic-boron steels and alloys designed for parts of welded structural elements of the power, chemical, and other branches of machine building and the characteristic features of welding austenitic-boride steels and alloys are described.

"Corrosion Resistance of Joints of EP668 Alloy in Nitrogen- and Sulfur-  
Containing Media"

Kiev, Avtomaticheskaya Svarka, No 11, Nov 70, pp 67-68

**Abstract:** A study was made of the corrosion resistance of high-chromium alloy Kh50N5V (EP668) and its welded joints in highly aggressive media involved in the production of sulfuric and nitric acids. It was found that EP668 alloy and its welded joints have a high corrosion resistance in media containing nitrogen oxides NO and NO<sub>2</sub>, natural gas with air, H<sub>2</sub>S, SO<sub>2</sub>, CO<sub>2</sub>, and HCN gases. In these media the maximum corrosion rate of the parent metal and its welds is 0.010 g/m<sup>2</sup>.hour. For comparison, tests were also conducted on the most extensively employed corrosion-resistant materials, including Kh18N10T, Kh18N12M2T (EP48), OKh21N6M2T (EP54), titanium, aluminum, and St.3 steel. Under similar conditions these materials exhibited intensive corrosion. EP668 alloy is also resistant in ammonium carbonate solutions (43% NH<sub>3</sub>, 34% CO<sub>2</sub>, 23% H<sub>2</sub>O) at 100°C and a maximum pressure of 200 atm.

"Austenitic-Boride Steels and Alloys for Welded Structures"

Austenitno-Boridnyye Stali i Splavy dlya Svarnykh Konstruktsiy [English Version Above], Kiev, Naukova Dumka Press, 1970, 147 pages.

Translation of Annotation: This book presents data on alloying of austenitic steels and iron-chrome-nickel, iron-chrome-manganese, and chrome-nickel-based alloys with boron. The influence of boron on the structure and properties of these materials is studied. Considerable attention is given to investigation of the influence of boron on the weldability, tendency to local rupture, corrosion cracking, heat resistance, and scale resistance of the steels and alloys.

The structures and properties of new types of austenitic-boride steels and alloys designed for welded structures in the power engineering, chemical, and other branches of machine building and the specifics of welding of austenitic-boride steels and alloys are described.

The book is designed for scientific and engineering-technical workers involved in metal science, metallurgy, and the welding of metals.

"Spectrographic Assay of Some Trace Elements in Biological Media"

Moscow, Laboratornoye Delo, No 5, 1970, pp 284-286

Abstract: A variant of spectrography is proposed for assaying zinc, copper, nickel, iron, aluminum, titanium, manganese, silicon and molybdenum in biological material (blood, gastric juice, bile, and organ tissues) in batches of 10 grams. This technique, which includes trace element extraction by the Pohl method, permits rapid assays on many samples and can be used in any laboratory that is equipped with an ISP-28 spark spectral unit, and IG-3 spark generator.

"Repair of Some Genetic Injuries in RNA-Containing Virus in Relation to Type of Cell"

Moscow, Doklady Akademii Nauk SSSR, No. 2, 1971, pp 457-459

Translation: Tickborne encephalitis virus treated with ethylenimine (1:10,000) was titrated in chick embryo (CE) and pig embryo kidney (PEK) cells. The survival rate of the virus was found to be one order higher in the PEK cells than in the CE cells, whereas the titers of control, untreated virus differed by no more than 0.1 to 0.2. Apparently some of the sublethal injuries to the virus caused by the mutagen are repaired in the PEK cells but not in the CE cells. The existence of a more active repair system in the PEK cells implies that the original viral characteristics are more stable in these cells or in the presence of

"Metal Ceramic Hard Alloys"

Metallokeramicheskiye Tverdyye Splavy (English Version Above), Metallurgiya  
Press, 1970, 352 pages

Translation of Annotation: This book presents in brief form the basic principles of the production and application of metal ceramic hard alloys. Information is presented on the initial raw material, and methods are described for producing powders of metals and carbides used in the manufacture of hard alloys.

Methods of grinding the initial materials and methods of preparing the mixtures and preassing them are described. Description are given of processes occurring during sintering of alloys, and methods of treating hard alloy products. Areas of their application in the metal working and mining industries are described. Methods of quality testing of products during preparation of hard alloys are discussed.

The book is designed as a teaching aid for professional and technical schools training workers in the production of metal ceramic hard alloys. 94 figs; 51 tables; 19 bibli. refs. 1/10

extracts from these cells. To test this assumption, mice were peripherally infected with a nonpathogenic strain of tickborne encephalitis virus. Spontaneous mutations with respect to the formation of a peripherally active phenotype occurred during 3 passages in CE cells but not in PEK cells or in CE cells in the presence of extracts from PEK cells.
